## C语言,两次遍历:

```
int* twoSum(int* nums, int numsSize, int target, int* returnSize){
      if( numsSize == 0)
          return 0;
      int value = 0;
      int *ret = (int *)malloc(2 * sizeof(int));
      for(int i = 0; i < numsSize-1; i++)
          value = target - nums[i];
          for(int j = i + 1; j < numsSize; j++)
           {
               if(nums[j] == value)
11
                    ret[0] = i;
13
                    ret[1] = j;
                    *returnSize =2;
15
16
           }
17
18
19
       return ret;
20 }
```

## python:

## 2 hashmap

```
def twoSum(nums, target):
    hashmap={}
    for i,num in enumerate(nums):
        if hashmap.get(target - num) is not None:
            return [i,hashmap.get(target - num)]
        hashmap[num] = i #这句不能放在if语句之前,解决list中有重复值或target - num)
```
